***Allowance***

Claims 1-36 were examined and considered allowable over the prior art.

Reasons for allowance of claim 1 are as follows:

Claim 1 contains the limitation:

A state-saving controller...which saves the state of the integrated circuit to the non-volatile memory when an **unrecoverable** error occurs in the integrated circuit and **after the internal clocks of the integrated circuit have been stopped so that latches of the integrated circuit retain their states upon the error in the operation of the integrated circuit** (sections in bold for emphasis).

Devices exist which are able to read the memory of integrated circuits, some for debugging purposes. However, none of the prior art inventions teach state-saving after an unrecoverable error, and after the internal clocks of the integrated circuit have been stopped, so that latches retain their states. Some references teach the use of the clock signal for memory reads, and some teach stopping the main clock of the processor and using an auxiliary clock signal for the memory scan process, but none exist which stop clocks entirely, and read the memory of the circuit.

Claims 14 and 27 are considered allowable for the same reasons as claim 1.

Claims 2-13, 15, 18-26, 28, and 31-36 are considered allowable as being dependant on base claims 1, 14, and 27.
